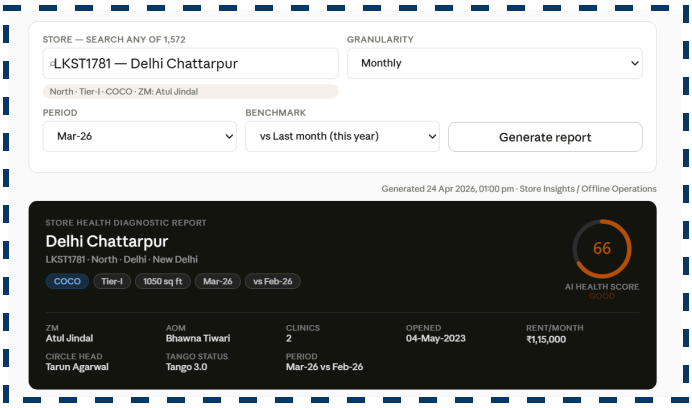
Store Performance Diagnostic Agent

An AI agent that identifies conversion change drivers per store, **generates store-specific actionable playbooks for degrowing stores**, and delivers **automated health reports** for Zonal Managers, built on the Store Insights Fabric semantic model.



What is it

An AI-powered store health engine

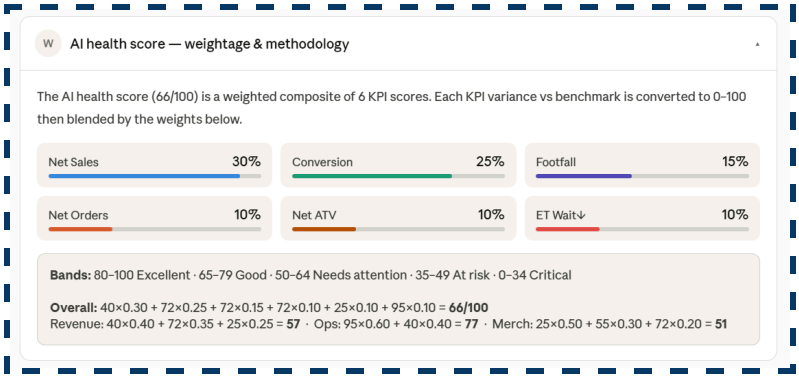
A conversational analytics agent connected **live** to Lenskart's Store Insights Power BI Fabric model via **XMLA**. It reads **15+ KPIs per store per period**, applies a structured 3-level diagnostic logic (**Funnel → Friction → Basket**), and surfaces the **root cause of store under-performance**, without a single dashboard or manual query from the ZM.

AI Agent | Live Data | No-code for ZMs

What it does

Diagnoses, scores and prescribes

Pulls **store KPIs** (Net Sales, Conversion, ATV, Footfall, ET Wait, UPT, Progressive share) · Computes an **AI Health Score** (0–100) across 4 sections · Identifies the exact **funnel stage where revenue is leaking** · **Classifies the leak** into one of 6 diagnostic scenarios · Generates a ZM-ready playbook with Immediate / Today / This week actions **named to specific staff**.



Health Score | Action Playbook | 1,572 stores

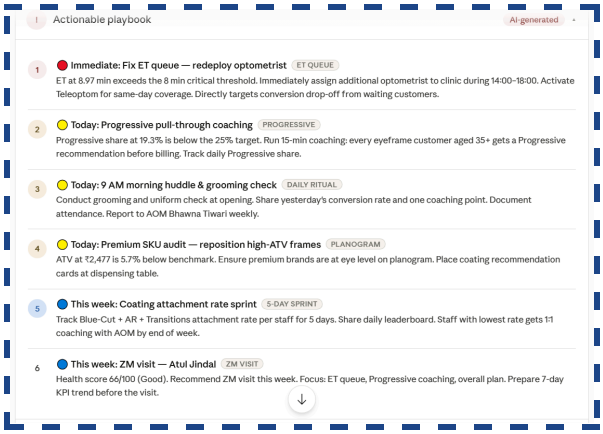
Problem & Solution

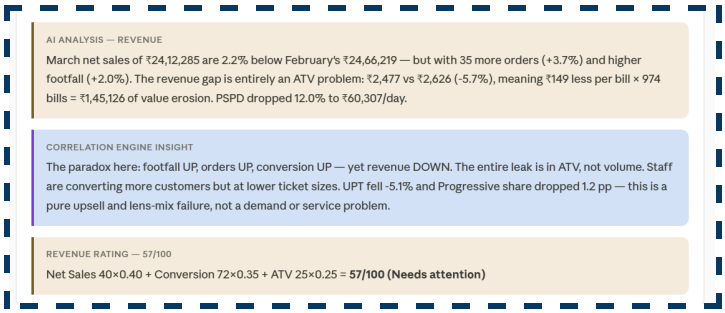
The Problem	The Solution
• Zms manage 15-30 stores but lack time to do root-cause analysis per store every week. • Revenue drop is visible in dashboards but the WHY ET queue, upsell failure, stock gap, football collapse is buried in multiple reports. • No structured playbook: every ZM gives generic advice without specific actions per store	• One conversational prompt generates a full structured diagnostic for any of 1,572 stores in any period • 3-level leakage logic isolates the exact funnel stage: Footfall → Conversion → ATV → Revenue • Conversion always derived as *Orders ÷ Footfall × 100*, verified against Power BI visuals • Named playbook: actions reference specific staff (ZM, AOM, optometrist), specific numbers, specific deadlines

How it helps decisions

From observation to intervention

The agent converts raw KPI data into a decision: which store to visit, what to fix, and who owns it. A ZM can look at the AI Health Score (eg. 66/100 - needs attention), read the correlation engine insight, and assign what coaching action to the AOM before leaving the weekly review call.





Quantified leak detection

Revenue gap in rupees, not percentages

Every report shows conv loss of orders and revenue, progressive share, footfall, ET wait time, etc. AI Health Score weights (Net Sales 30%, Conversion 25%) are configurable assumptions, not fixed
